

Logging & Monitoring

» Logging

Overview

Create a simple pod that outputs the date every second.

```
kubectl run logdate --image busybox --restart Never -- /bin/sh -c 'while true; do date; sleep 1; done'
```

Use the `--tail` flag when you just want to view a specific number of log lines.

```
kubectl logs --tail=5 logdate
```

Stream the logs from the pod.

```
kubectl logs -f logdate
```

Use the `--since` flag to limit the number of log lines based on time.

```
kubectl logs -f --since=10s logdate
```

Type `CTRL+C` to stop streaming the logs.

Clean up the pod when finished.

```
kubectl delete pod logdate
```
